SwiftLog Logistics Limited

Business Analysis and Strategic Recommendations

1. Executive Summary

SwiftLog is making sales, but some parts of its operations need attention. From January to 8 September 2026, it recorded 5,000 orders, generated about ₦21.67 million in revenue and served 1,000 customers. Revenue is spread across products, cities and categories, so the business does not rely on just one category. Delivery is the main concern: only 36.28% of shipments arrive on time, and delayed shipments are about five days late on average. Returns account for about 10% of orders, and roughly one-third of orders are cancelled. Stock levels are also high, with about 1.0 million units in stock compared with 82,000 units ordered.

This report answers ten business questions using the five dashboard pages and gives twelve recommendations based on the findings.

KPI Summary

KPI	Value	Insight
Total Revenue	₦21,668,066	Revenue spread across categories
Total Orders / Customers	5,000 / 1,000	Business activity
Average Order Value	₦4,333.61	Average spend per order
On-Time Delivery Rate	36.28%	Needs urgent attention
Delayed Shipments	3,186 of 5,000 (63.7%)	Needs urgent attention
Average Delivery Delay	3.57 days overall; 5.03 days for delayed shipments	Needs attention
Return Rate	10.0% (500 returns from 5,000 orders)	Needs attention
Inventory Turnover	0.08; 1,007,764 units in stock	Possible overstocking
Order Status Mix	Pending 34.3%; Delivered 33.2%; Cancelled 32.5%	Needs attention

2. Business Analysis

Q1. Which products generate the highest revenue?

Fashion leads by category with ₦8.06 million (37.2% of revenue), followed by Food at ₦7.11 million (32.8%) and Electronics at ₦6.50 million (30.0%). The difference is small, so no single category carries the business. The top five products by revenue are P040 (Electronics, ₦191,464), P085 (Food, ₦187,416), P186 (Fashion, ₦180,896), P234 (Food, ₦179,609) and P125 (Fashion, ₦174,692). Together, they make up 4.2% of revenue. P245, P130 and P007 sell the most units, at 487, 449 and 446. P245 earns ₦80,589 despite its high sales volume, likely because its price is low. P176 (₦3,840) and P048 (₦4,023) have the lowest revenue.

Dashboard evidence: Supplier & Product Analysis and Executive Summary pages.

Q2. Which customers contribute the highest revenue?
The top five customers are Customer 263 in Lagos (₦74,103), Customer 815 in Ibadan (₦70,177), Customer 512 in Kano (₦69,852), Customer 223 in Kano (₦69,398) and Customer 597 in Lagos (₦65,425). The top 10 customers account for 3.0% of revenue, while the top 100 (10% of customers) account for 22.1%. Customer 581 in Ibadan placed the most orders, with 15. Kano brings in the most city revenue at ₦5.68 million (26.2%), followed by Lagos at ₦5.53 million, Abuja at ₦5.23 million and Ibadan at ₦5.23 million. Ibadan has the most customers (262) but the lowest revenue per customer, about ₦20,000 compared with roughly ₦22,400 in Kano and Lagos.

Dashboard evidence: Customer Analysis page.

Q3. Which warehouses operate most efficiently?
Based on on-time delivery and average delay, W01 in Abuja performs best, with 41.3% on-time delivery and an average delay of 3.46 days. W10 in Kano has 40.1% on-time delivery, while W07 in Lagos has 39.6% and handles the most shipments (371). The weakest are W05 in Lagos (32.0% on time and 3.79 days average delay), W09 in Lagos (32.5%) and W03 in Abuja (32.6%). The gap between the best and weakest warehouse is about nine percentage points. Kano has the best location-level on-time rate (37.5%), followed by Abuja (36.4%) and Lagos (35.7%). Workloads also differ: W14 handles about 38 shipments per employee, W15 about 35 and W12 about 34, compared with about 20 at W13 and W03.

Dashboard evidence: Shipment & Delivery Analysis and Inventory & Warehouse Analysis pages. Warehouse-level results use Shipments, Delivery_Performance and Employees.

Q4. Which suppliers consistently perform well?
The average supplier on-time rate is 36.9%, and only two of the 150 suppliers reach 50%. Supplier 85 performs strongly, with 52.4% on-time delivery, a 2.9-day average delay and a 1.6% return rate. Its product is also the second-highest revenue earner. Supplier 65 has 48.6% on-time delivery and 2.9% returns, while Supplier 116 has 52.3% on-time delivery and 6.2% returns. The weakest on delivery are Supplier 60 (21.0% on time and 4.0-day delay), Supplier 73 (22.2% and 4.3 days), Supplier 47 (26.2%) and Supplier 104 (27.1%). One limitation is that 100 of the 250 products have no matching supplier record, so results cover about 60% of revenue.

Dashboard evidence: Supplier & Product Analysis and supplier/product/shipment relationships.

Q5. Which products have the highest return rates?
For products with at least 40 orders, the highest return rates are P032 (Fashion, 21.3%), P040 (Electronics, 19.2%), P017 (Fashion, 18.9%), P161 (Food, 18.9%), and P020 and P071 (18.6% each). P040 is also the top revenue product and has the most returns (14), so it needs closer review. Return rates by category are similar: Electronics 10.2%, Food 10.1% and Fashion 9.8%. Late Delivery accounts for 185 returns (37.0%), Wrong Item for 163 (32.6%) and Damaged for 152 (30.4%). Abuja has the highest city return rate (11.2% of orders), while Lagos has the lowest (8.8%).

Dashboard evidence: SwiftLog_Returns linked to Orders, Order_Items and Products.

Q6. Which regions experience the most delayed deliveries?
Lagos has 1,701 delayed shipments out of 2,647 (64.3%), accounting for 53% of all delays. Abuja follows with 849 delayed shipments (63.6%), and Kano has 636 (62.5%). The difference between locations is under two percentage points. This suggests delays affect the whole network and cannot be fixed by focusing on only one location.

Dashboard evidence: Shipment & Delivery Analysis page.

Q7. Which months record peak business activity?
August 2026 is the busiest month, with 626 orders and ₦2.85 million in revenue. April follows with 597 orders and ₦2.74 million, then May with 593 orders and ₦2.72 million. Quarter 2 is the strongest quarter, with 1,747 orders and ₦8.00 million in revenue. February is the quietest complete month, with 552 orders and ₦2.51 million. September data only runs to 8 September, so it should not be compared with full months.

Dashboard evidence: Executive Summary page and Quarterly slicer.

Q8. Which KPIs need immediate attention?
1. On-Time Delivery Rate (36.3%): nearly two in three shipments are late. 2. Order status: 33.2% are Delivered, 34.3% remain Pending and 32.5% are Cancelled. Revenue includes all statuses, so delivered-order revenue is about ₦7.11 million. 3. Average Delivery Delay is 3.57 days overall, while delayed shipments are about five days late. 4. Return Rate is 10%; wrong items and damaged goods account for about 63% of returns. 5. Inventory Turnover is 0.08, and high stock levels may be tying up working capital.

Dashboard evidence: Executive Summary, Shipment & Delivery Analysis, and Inventory & Warehouse Analysis pages.

Q9. What operational inefficiencies were identified?
Late delivery affects every location and warehouse. From January to August, about 61% to 67% of shipments were late each month. About one-third of orders are cancelled and another third remain pending. Cancelled orders still have shipment records (1,626), which may mean wasted handling. Stock is uneven: the median product has about 12 times more stock than the quantity ordered, but 746 warehouse-product records (18.7%) have fewer than 100 units. Shipments per employee range from about 20 to 38 across warehouses. Wrong-item and damaged returns make up 63% of returns. Also, 36% of returns labelled Late Delivery relate to shipments recorded as on time, suggesting that recorded delivery status may not always match the customer's experience.

Dashboard evidence: Inventory & Warehouse Analysis and Shipment & Delivery Analysis pages.

Q10. What business opportunities should SwiftLog pursue?
SwiftLog can protect repeat customers with a loyalty programme. About 96% of customers who ordered have ordered more than once, and the top 100 customers account for 22.1% of revenue. Ibadan has the most customers but the lowest spend per customer, so targeted offers could help increase spending. Fashion contributes 37.2% of revenue, and stock can be prepared ahead of the April-May and August

peaks. Excess stock could be reduced or moved to locations with lower stock. Suppliers 85 and 65 can be reviewed to understand practices linked to better delivery and fewer returns.

Dashboard evidence: Customer Analysis, Supplier & Product Analysis and Executive Summary pages.

3. Recommendations

Each recommendation is based on a dashboard finding. The targets are suggested goals for management to review, not guaranteed forecasts.

Area	Findings	Recommendation	Expected Impact
Delivery optimization	Only 36.3% of shipments arrive on time; delayed shipments average 5.03 days late.	Set a delivery target and review delayed shipments weekly. Record likely causes such as carrier, route, warehouse or product.	Improving on-time delivery from 36% to 50% would mean about 680 fewer late shipments at current volume.
Logistics optimization	Lagos accounts for 1,701 of 3,186 delayed shipments (53%) and has the lowest location-level on-time rate (35.7%).	Review Lagos routes, dispatch times and carrier partners first. Compare its process with Kano.	Could reduce delays in the location with the highest volume.
Warehouse efficiency	On-time rates range from 41.3% at W01 to 32.0% at W05. W03, W05 and W09 are weakest.	Review W05, W09 and W03, then share useful practices from W01, W10 and W07.	Closing half the gap could improve network on-time performance.
Warehouse staffing	W14 handles about 38 shipments per employee, W15 about 35 and W12 about 34, compared with about 20 at W13 and W03.	Review staffing or shifts at W14, W15 and W12. Track shipments per employee monthly.	Could reduce pressure at the busiest sites and lower delay risk.
Inventory management	Inventory turnover is 0.08. Stock is high compared with demand, while 746 warehouse-product records have fewer than 100 units.	Set reorder points by product and warehouse. Move excess stock to locations running low before ordering more.	Could free up working capital and reduce local stock shortages.
Supplier improvement	Average supplier on-time rate is 36.9%. Suppliers 60, 73, 47 and 104 have rates between 21% and 27%.	Create a quarterly scorecard covering on-time rate, delay days and returns. Agree improvement plans with the weakest suppliers.	Could reduce supplier-related delays and support contract decisions.

Supplier quality	Suppliers 32, 17, 108 and 20 have return rates between 17% and 21%. P032 and P040 return at about 19% to 21%.	Check incoming stock from these suppliers and products, then agree return-reduction targets.	Could reduce damaged-item and wrong-item returns.
Return reduction	Returns are 10% of orders. Late Delivery accounts for 37%, Wrong Item 32.6% and Damaged 30.4%.	Add a pick-and-pack accuracy check, improve packaging for fragile goods and give customers realistic delivery dates.	Reducing returns from 10% to 8% would mean about 100 fewer returns at current volume.
Operational cost reduction	32.5% of orders are Cancelled and 34.3% are Pending. Cancelled orders still have 1,626 shipment records.	Find out why orders are cancelled or delayed. Stop dispatch handling for cancelled orders and review pending orders daily.	Could reduce wasted handling and transport costs and help complete more sales.
Customer retention	About 96% of ordering customers are repeat buyers. The top 100 customers account for 22.1% of revenue.	Start a loyalty or priority-service programme for the top 100 customers and track repeat purchases monthly.	Could help protect around one-fifth of revenue.
Business growth	Fashion contributes 37.2% of revenue. Kano leads city revenue at 26.2%, while Ibadan spend per customer is about 11% lower than in Kano and Lagos.	Promote leading Fashion products, test targeted offers for Ibadan and prepare stock before April-May and August.	Could increase revenue from the existing customer base.
Performance monitoring	Order status, shipments per employee and supplier on-time rates became clearer after deeper analysis.	Add cancellation rate, shipments per employee and supplier on-time rate to the dashboard. Review them weekly and fix data gaps such as supplier links and duplicate stock rows.	Could help management spot issues earlier and make decisions using more complete data.

4. Data Notes and Limitations

- Revenue is calculated as quantity multiplied by unit price. It includes Pending and Cancelled orders, and each status accounts for about one-third of revenue.
- Of 5,000 orders, 236 have no line items, and 9 customers have never ordered.

- Three Inventory rows are exact duplicates. The dashboard total of 1,007,764 units includes them; the cleaned total is 1,006,935.
- 100 of 250 products have no matching supplier record, so supplier findings cover about 60% of revenue.
- Warehouse locations in the data are Lagos, Abuja and Kano. In this report, 'region' refers to warehouse location.
- Low stock means fewer than 100 units in a warehouse-product record because the data does not include reorder levels.
- Order data runs from 1 January to 8 September 2026, so September is incomplete.

5. Conclusion

SwiftLog has a solid sales base, repeat customers and revenue spread across product categories. The main problems are operational: late deliveries, cancelled and pending orders, avoidable returns and excess stock. The first priorities should be to improve delivery performance, starting with Lagos; deal with pending and cancelled orders; and introduce regular supplier and warehouse scorecards. These steps could improve service and free up cash without depending only on getting more sales.
